

Grain Handler Dryer Retention Time Versus Other Dryers

- Retention time is the amount of time grain is in the dryer during the drying process.
- Dryers that have a long retention time produce high quality grain. They also minimize rebound in the dry bin.
- Grain Handler has the longest retention time due to the consistent temperature at which the grain is heated. Grain Handler Dryers protect the grain bushel weight. This ensures your grain is dry but has the highest possible bushel weight.

Based on manufacturer's published data, retention time was calculated by dividing the holding capacity by the bushel per hour throughput.
